Students management Class

Create a basic system to manage student grades for a university course. The system should handle student information and allow for adding, searching, and displaying grades.

1. **Student Class:**

    -   **Create a class named Student with the following attributes:**

        -   String name (student's name)

        -   int id (student's ID number)

        -   double[] grades (array to store up to 5 grades)

    -   **Methods:**

        1. Constructor to initialize name, id, and an empty grades array.

        2. Method to add grades: Overload the addGrade() method to allow adding grades in two ways:

        -   addGrade(double grade) – **adds a single grade.**

        -   addGrade(double[] grades) – adds multiple grades at once.

        3.Method to display student information: displayInfo() – prints the student's name, ID, and grades.
